We live in a fast paced world and we're always looking for the fastest way to get things done.

Keywords:

speed up computer, increase computer speed, speed up computer free

Article Body:

We live in a fast paced world and we're always looking for the fastest way to get things done.

Barring adding more RAM to your computer, there are 6 steps you can take to speed up your computer.

One of the first steps you should take is to empty the Recycle Bin. It's easy to do. Just point and click.

Next, open up your Internet Explorer, go to Tools, Internet Options. Click on "Delete Cookies, History, and Temporary Internet Files".

Those two are steps that are the quickest, and simplest ones so that's why we got them out of the way first.

Now it's time to do a disk defragmentation. This can be a long process so you should probably schedule it to run automatically.

Once that's done, it's time to run a spyware scan. Most people don't realize how easy it is to get spyware on your computer.

This last step is to run an anti-virus scan. Hopefully you have an anti-virus program installed on your computer.

Once all the steps are complete. Restart your computer and you'll be surprised at how complete the process is.
