

Title:

It Facility Management - Reasons To Outsource

Word Count:

455

Summary:

A typical IT Equipment Room has around eight different types of machinery as part of the room.

The infrastructure equipment supporting an IT Equipment Room can be made up of some or all of the following: Standby Generator, UPS system, Electrical Switchgear and distribution, Fire Suppressant system, etc.

Keywords:

ITFM, UPS, IT facility management

Article Body:

A typical IT Equipment Room has around eight different types of machinery as part of the room.

The infrastructure equipment supporting an IT Equipment Room can be made up of some or all of the following: Standby Generator, UPS system, Electrical Switchgear and distribution, Fire Suppressant system, etc.

The handling of the day-to-day administration of all of these maintenance contracts, placed with the manufacturer, is a significant cost.

This is the reason that companies are increasingly outsourcing their IT Facility Management. An external contractor can take over the day-to-day administration of all of these contracts.

The outside contractor assumes responsibilities for existing contracts, or will be able to reduce the cost of the contracts.

Take, for example the UPS system for the computers. The external IT facilities management contractor can take over the day-to-day administration of the UPS system.

Modern processors in computers are very vulnerable to voltage spikes in the mains power supply. A voltage spike can cause a computer to crash, and in some cases, it can cause permanent damage to the computer.

People think that because they are paying for a 115v or 230v (UK) supply that that is what they need. They think that because they are paying for a 115v or 230v (UK) supply that that is what they need.

You can protect your computers and the systems that depend on them by fitting a Uninterruptible Power Supply (UPS). A UPS will provide a clean, stable power supply to your computers and systems.

The simple plug-in devices are a waste of time and money if your business computer crashes. They do not provide any protection for your computers and systems.

If you want any protection at all you need to consider a system that has sufficient battery power to keep your computers and systems running for a period of time.
