

Title:

Autism and its Generated Behavioral and Mental Impairments

Word Count:

455

Summary:

Autism is a complex neurological disorder that dramatically affects people's behaviors and social interactions.

Keywords:

autism, autism causes, child autism

Article Body:

Autism is a complex neurological disorder that dramatically affects people's behaviors and social interactions.

Egocentrism is a major behavioral characteristic of children with autism, who may even ignore the needs of others.

The communication skills of autistic children are also impaired. While some children with autism can communicate, others cannot.

Autism can be anywhere from mild to very pronounced. Children who suffer from milder forms of autism may have difficulties with social interactions.

Although the exact causes of autism haven't yet been identified by medical science, it is believed to be a genetic disorder.

Considering the fact that there is no cure for autism, medical treatments available today can help manage the symptoms.

With the aid of medical treatments and the support of their families, autistic children can eventually lead a normal life.
