

Title:

Body Piercing And The Risk Of Infection

Word Count:

400

Summary:

Just like any type of trauma to a part of your body, body piercing comes with a risk of infection.

Keywords:

belly button rings,body jewelry,piercing

Article Body:

Just like any type of trauma to a part of your body, body piercing comes with a risk of infection.

Before you even decide to pierce any part of your body, your main concern should be finding a professional piercer.

Individuals who have their body parts pierced are most likely to experience an infection as the result of the following signs:

- Discharge of pus or liquid around the wound
- Fever
- Pain around or near the wound
- Red streaks originating from the wound or red flesh around the wound

If you experience any of these signs of infection or any pain associated with the wound, be sure to see a doctor immediately.

To ensure your piercing hole does not become infected, take care of the wound using the instructions provided by your piercer.
