sexual health problems

Article Body:

When a woman loses her desire for sex, it's not just in her head. The loss of sexual desire is  
Many factors may be attributed to a lack of sexual desire and drive in women including:

- Interpersonal relationship issues including partner performance problems, lack of emot
- Socio-cultural or career factors including job stress, peer pressure, and media images
- Low testosterone also affects sexual drive in both men and women. Testosterone levels
- Medical problems or mental illnesses such as depression, or medical conditions, such a
- Medications such as antidepressants (including the new generation of selective serotonin
- Age is also a factor since androgens fall continuously in women as they age.

Since women's loss of sexual desire is caused by a combination of physical and psychological f
