Article Body:

Autism is a brain disorder that begins in early childhood, usually within the first three years

- learning difficulties i.e. he lacks in ability to learn inductively from surrounding events,
- communication or speech problems,
- difficulty relating to people, marked by a lack of awareness of the feelings of others, indifference,
- lack of social interaction,
- short attention span,
- not exhibiting creative or imaginative play,
- performing actions that are often repetitive and unchanging like twirling objects or rocking,
- reacting extremely to changes in the immediate environment.

Autistic children appear to lack the ability to see things from another person's perspective,

Autistic traits continue into adulthood, but vary in severity. Some adults with autism do well

Autism is a pervasive developmental disorder with an unknown origin. It is a bioneurological disorder

Surprisingly some autistic individuals may be outstandingly good at some kinds of mental manipulation

With intense therapy, practice and schooling, some children diagnosed with autism can improve

Asperger's syndrome and developmental delay syndromes are two of the related categories of Autism

A key indicator to physicians making a proper assessment for autism would include looking for
