Along with oxygen and heat, a burning material is needed for fire to take place and the most common material is wood.

There are several designs of outdoor log storage devices on the market ranging from wicker baskets to metal racks.

Firewood racks are typically two planks of wood which make up the base, with supporting 'bookends' on the sides. It may seem as if the properties of a wood rack are not particularly important considering its purpose.

One way to fully ensure that a firewood rack remains durable and dry is to treat it with a special preservative.

Non-wooden firewood racks are also a popular choice, made from steel tubing which is light yet sturdy.

Specially fitted canvas covers are available to fit neatly over a firewood rack so that rain, snow, and sun are kept off.

Whether you have an outdoor fire or indoor furnace, a firewood rack is incredibly useful in keeping your wood dry and ready for use.
