

Title:

Setting the Mood and Creating the Atmosphere

Word Count:

466

Summary:

One of mankind's earliest learned achievements was the ability to make fire around 800,000 years ago.

Keywords:

When spending time outdoors at night, an electric light can get too bright and you just want to turn it off.

Article Body:

When spending time outdoors at night, an electric light can get too bright and you just want to turn it off.

Early lanterns include fireflies that the Chinese would trap in jars and the kerosene fuel-burner.

Modern day lanterns are still a common feature of gardens whether they burn fuel or simply house a candle.

Garden lanterns are very rarely made from anything but metal and are typically made from cast iron.

Not only are these the most suitable material for the job, but they allow the lantern to be made in a variety of shapes.

Although there is always a safety risk with any kind of burning lantern, the candle lantern has the least risk.

Non-electric garden lanterns seem to prevail as leading outdoor light sources because of the safety and the variety of styles.
