All cells contain DNA, including the sex cells, sperm and egg cells. When a sperm and egg cell combine, they form a new cell.

There is only a tiny chance of two individuals having identical DNA, unless they are identical twins.

DNA analysis can be used to pinpoint an individual at the scene of a crime. This is particularly useful in cases where the suspect is unknown.

DNA analysis can be used to prove or disprove paternity. This is commonly used in cases where the father is unknown.

Where people were adopted as infants and are looking for their natural parents, DNA analysis can be used to identify them.

Your birth parents do not need to have registered to get a result. If any person related to you is registered, you can get a result.
