

Title:

Where did LED Technology Come From?

Word Count:

548

Summary:

It is becoming a widely-known fact that LED technology is poised to become the next evolution. This article provides a history of the technology, where it came from and how it evolved.

Keywords:

led light, led lights led flashlights, led light bulb, light emitting diode, white led

Article Body:

Light-emitting diodes (LEDs) were an accidental discovery at first. At the beginning of the 20th century, scientists discovered that certain materials could produce light when an electric current was applied. This was the start of the LED revolution.

Nearly 20 years later Russian and German scientists revisited the idea of light produced this time by a different process. They discovered that certain materials could produce light when an electric current was applied. This was the start of the LED revolution.

This was the start of the LED revolution. From that point each decade brought advances in the technology. This technology has led to additional uses for the LED as well. Due to their low light output, LEDs are used in a variety of applications. The first LED flat panel television prototype was produced in 1977, by James P. Mitchell. This was the start of the LED revolution.

This technology has led to additional uses for the LED as well. Due to their low light output, LEDs are used in a variety of applications. The first LED flat panel television prototype was produced in 1977, by James P. Mitchell. This was the start of the LED revolution.

The first LED flat panel television prototype was produced in 1977, by James P. Mitchell. This was the start of the LED revolution. As the LED technology advanced and the luminescence increased, the uses for LEDs increased. LEDs are used in a variety of applications. From an accidental discovery to a common household name, the history of LEDs is a long one. This was the start of the LED revolution.
