Article Body:

Air conditioning, which was once a great luxury, is now a common feature on most motor vehicles.

1. Odd smells coming from the air conditioning may be caused by bacterial buildups

As your car becomes older, or when the air conditioning system is used infrequently, bacteria,

This problem can be solved by using an anti-bacterial treatment that destroys the bacteria growth.

2. If your car does not feel cold enough, then you may need to recharge your system

If you feel that your car doesn't feel as cold as your friend's car, then your system may need

Most problems of this type can be put right fairly easily by a leak check of your system followed

3. Running your air conditioning year round will help maintain the system

If you run the air conditioning in the winter it will help to keep the system well lubricated

4. Strange noises coming from the air conditioning should be attended to immediately

If your air-con system suddenly starts making noises you have not heard before it is very advisable

Some noises could be early symptoms of a compressor failure (the compressor is the air conditioning

5. Don't worry about a pool of water forming under your car after using the A/C

If you see a puddle of water on the ground, usually under the passenger area don't be alarmed.

6. Excessive moisture inside the car can be fixed easily

Sometimes the drain tube from the evaporator may become blocked or detached allowing the condensation

7. Have your air conditioning serviced regularly, even if there are no visible problems

Just as the other systems of your car need servicing on a regular basis, the same is true for

Normally the refrigerant gas in a car air conditioning system has to be recharged completely w

An annual servicing of your car's air conditioning system will guard against malfunctions in t
